Для измерения времени жизни необходимо 10^{10} событий $\mu \rightarrow e \bar{\nu} \nu$
для μ^- и μ^+

$$\Lambda_d = \frac{1}{\tau_{\mu^-}} - \frac{1}{\tau_{\mu^+}}$$

Cryo_TPC как активная мишень

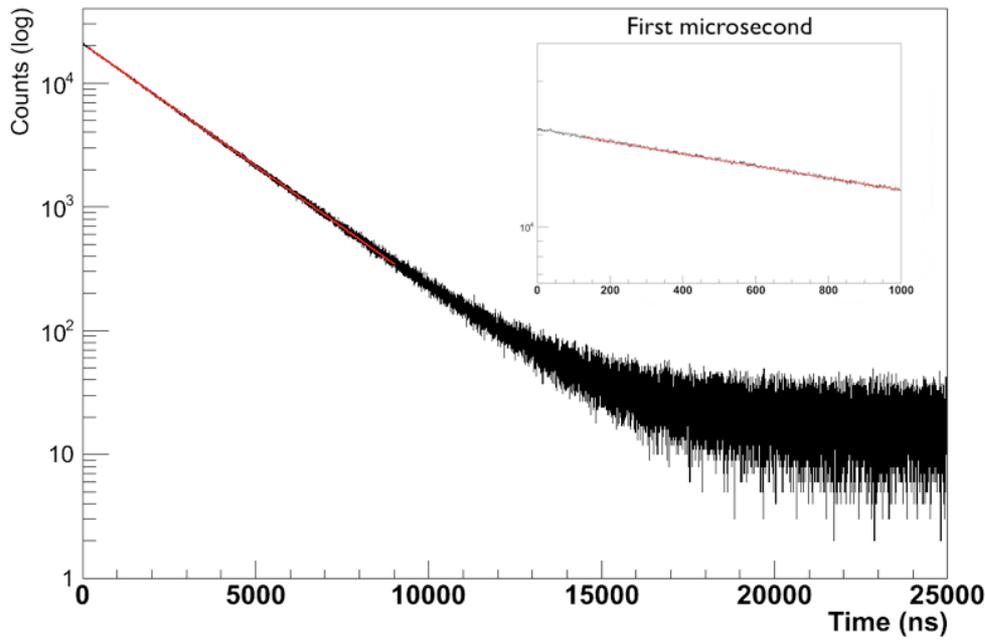

$$\mu \rightarrow e \nu \bar{\nu}$$

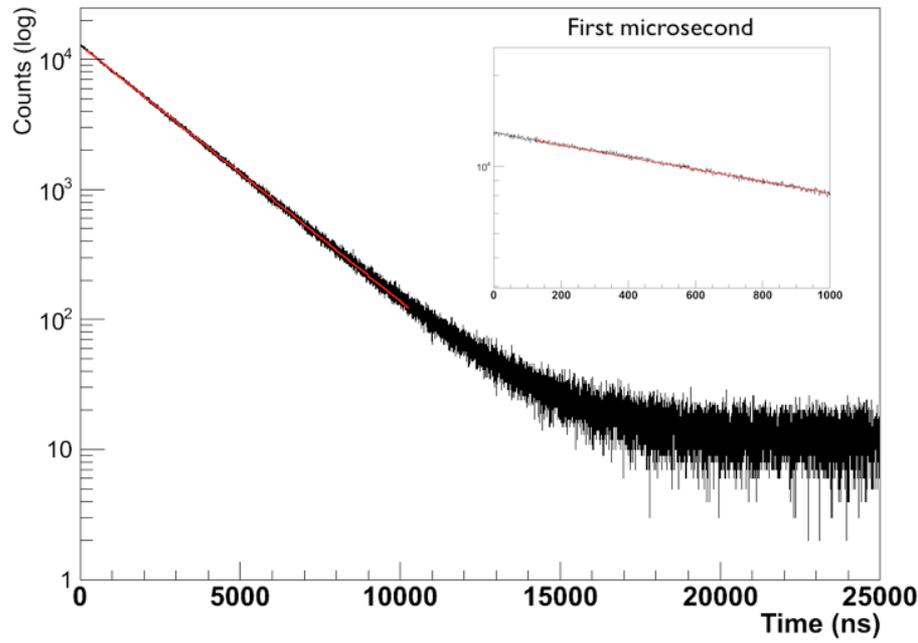

$$\mu^- + d \rightarrow n + n + \nu_\mu$$

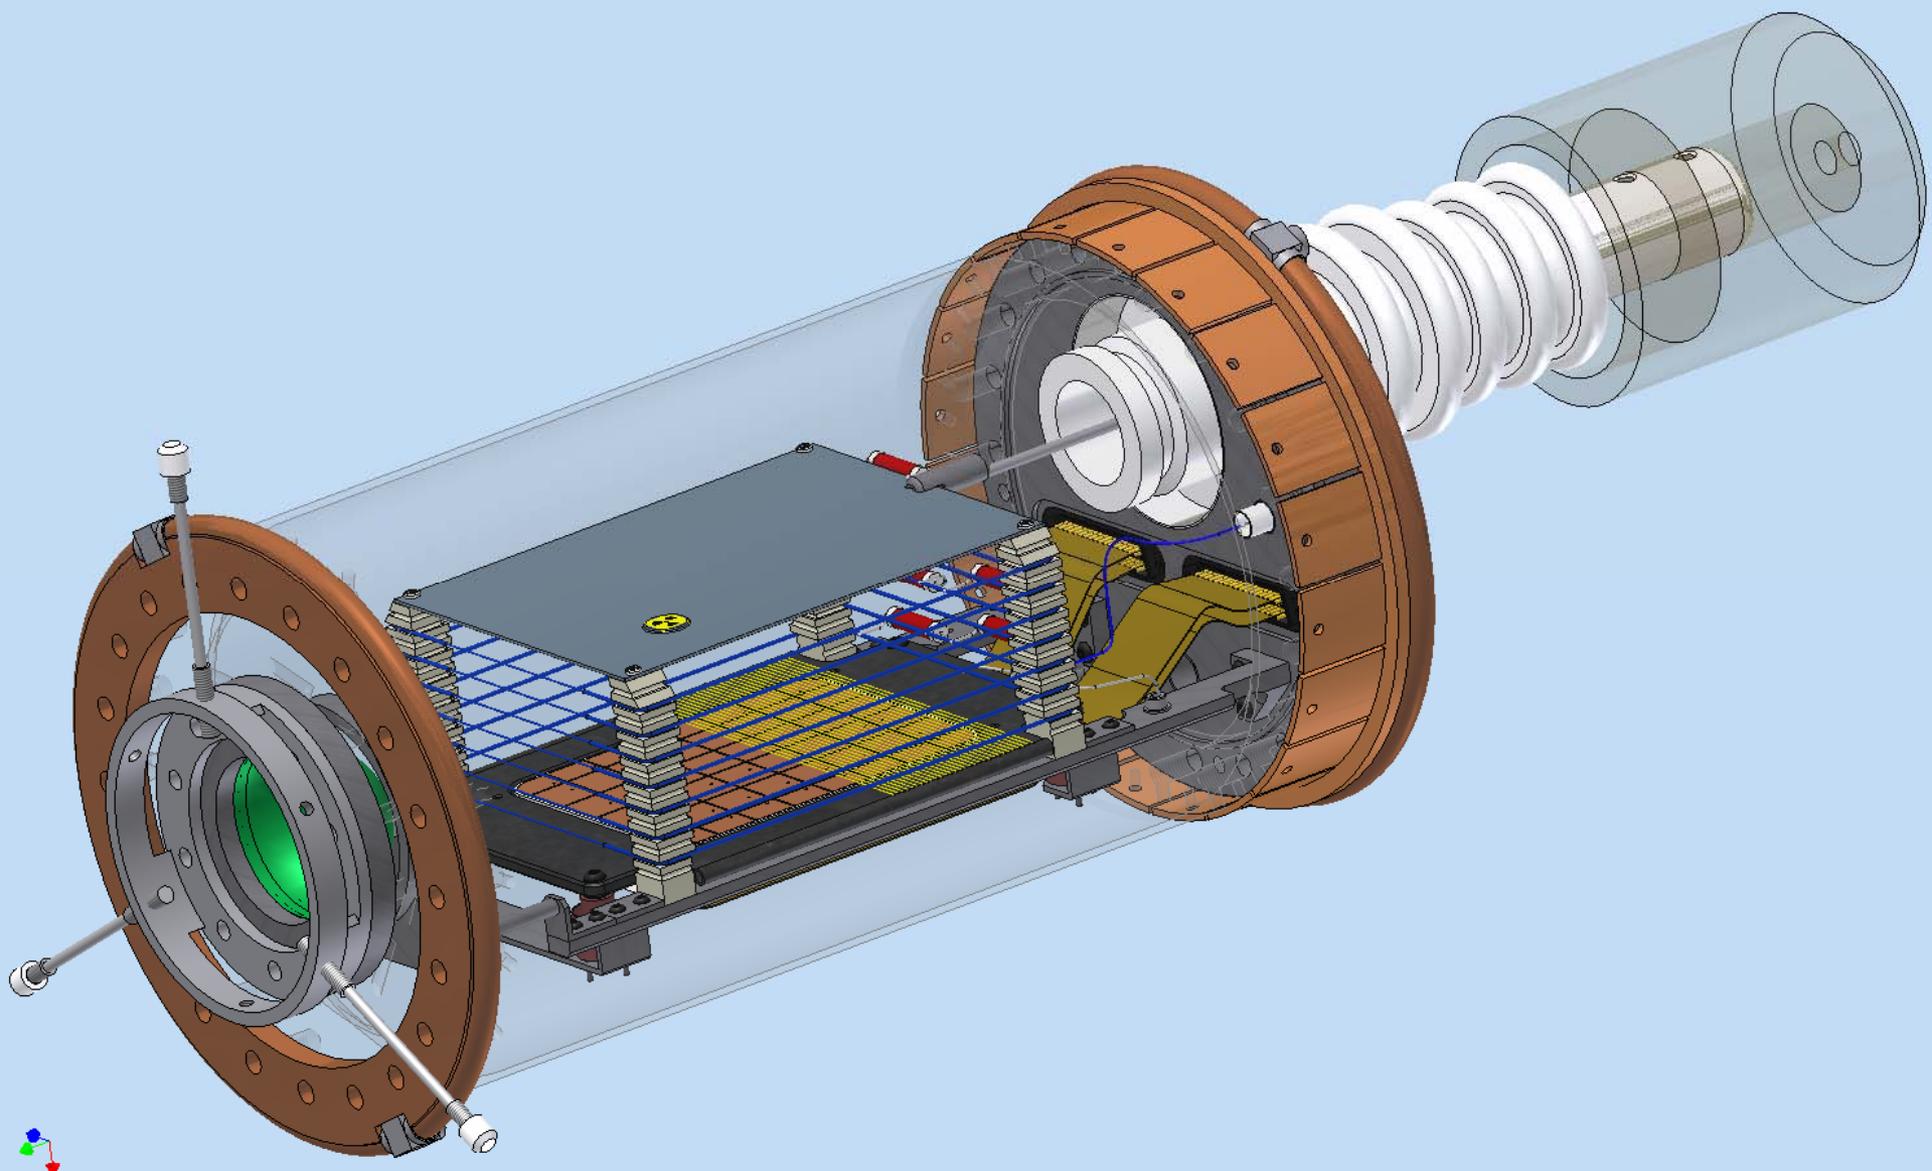

μ^- Lifetime

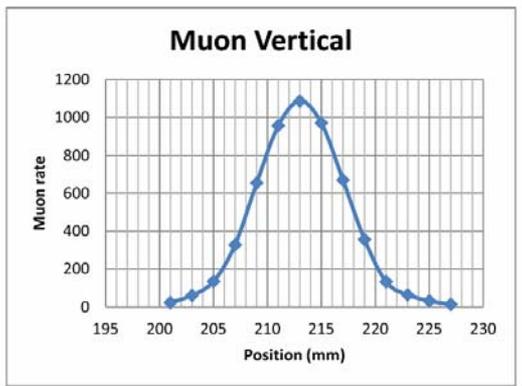

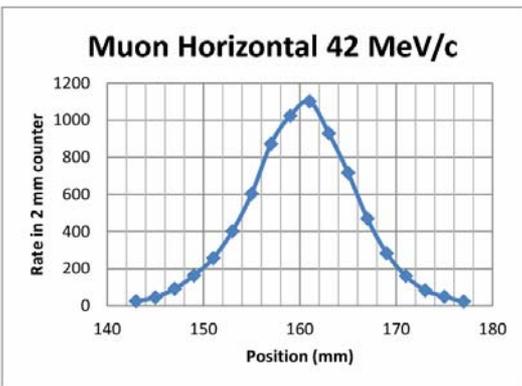

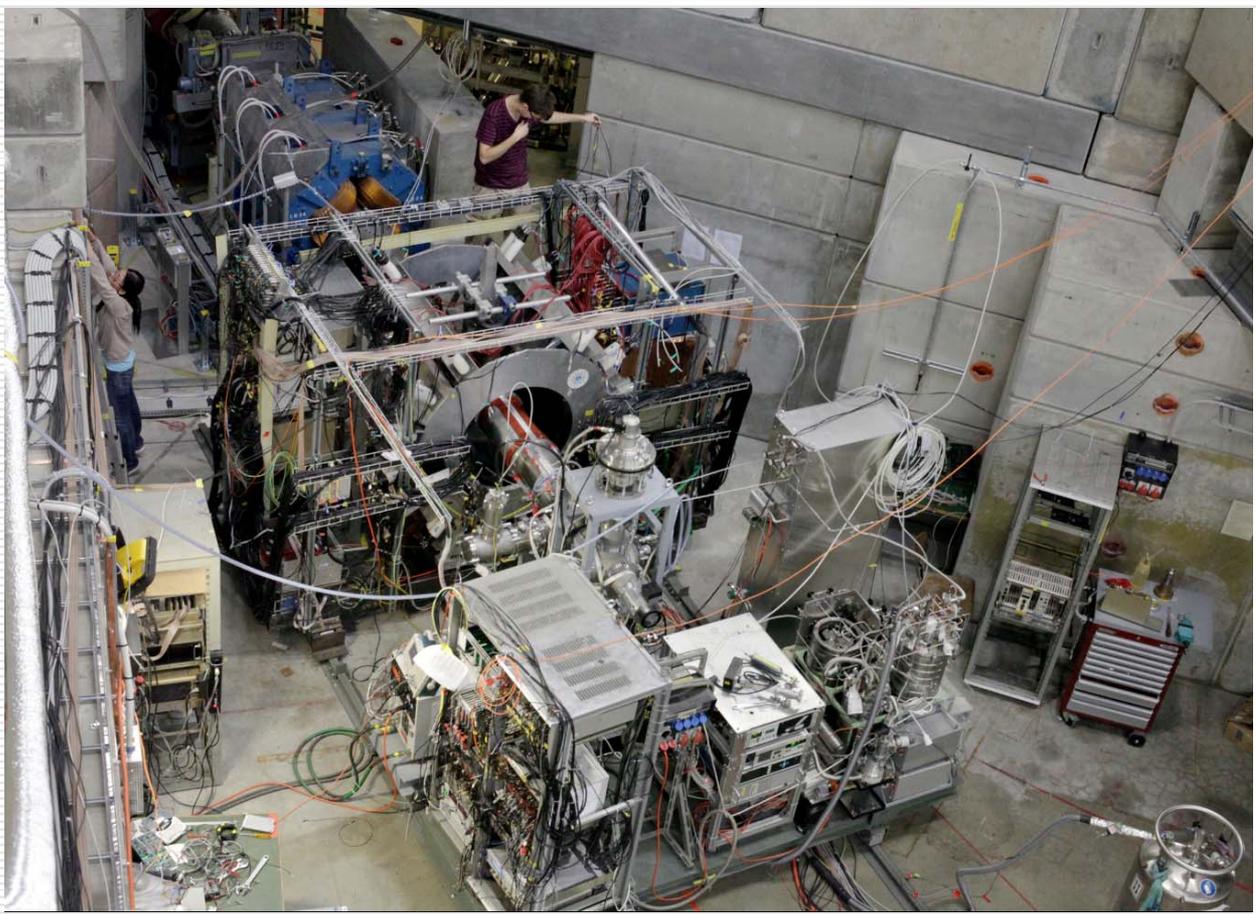

μ^+ Lifetime

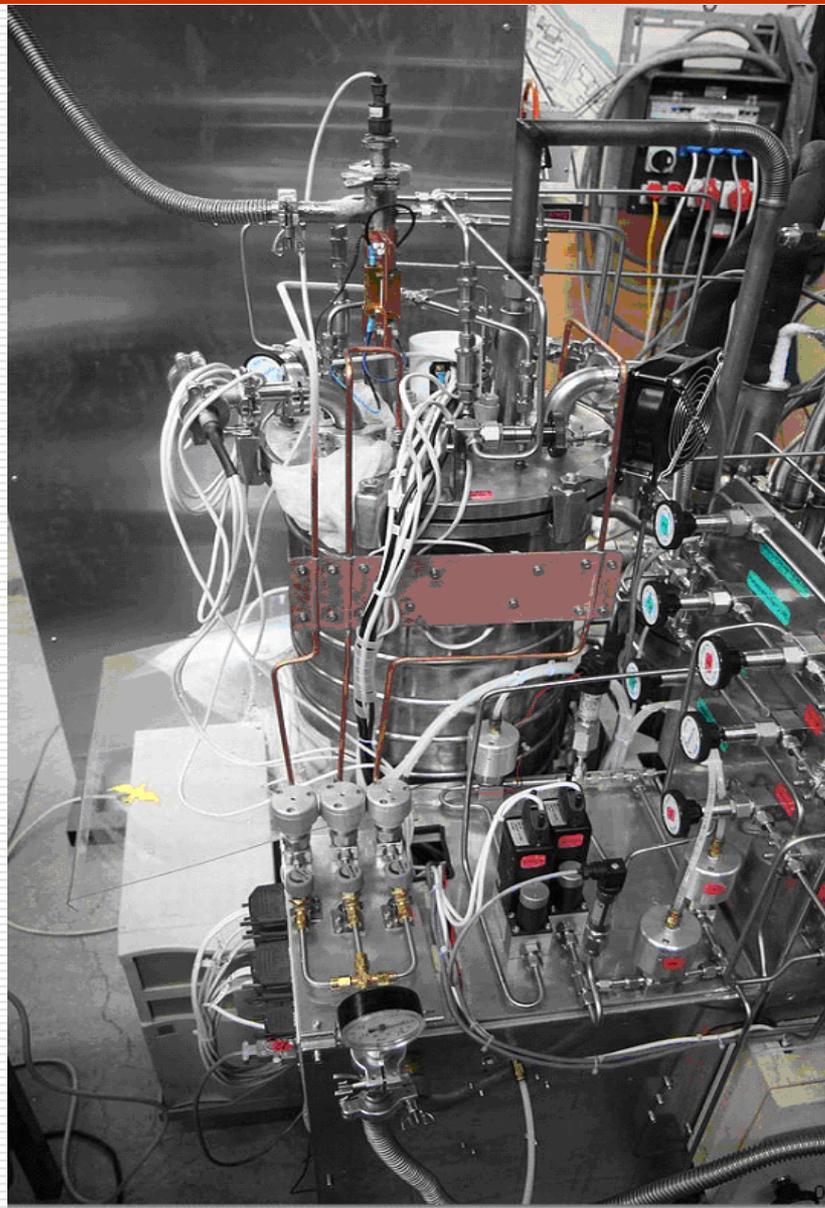

Проводка пучка к экспериментальной установке

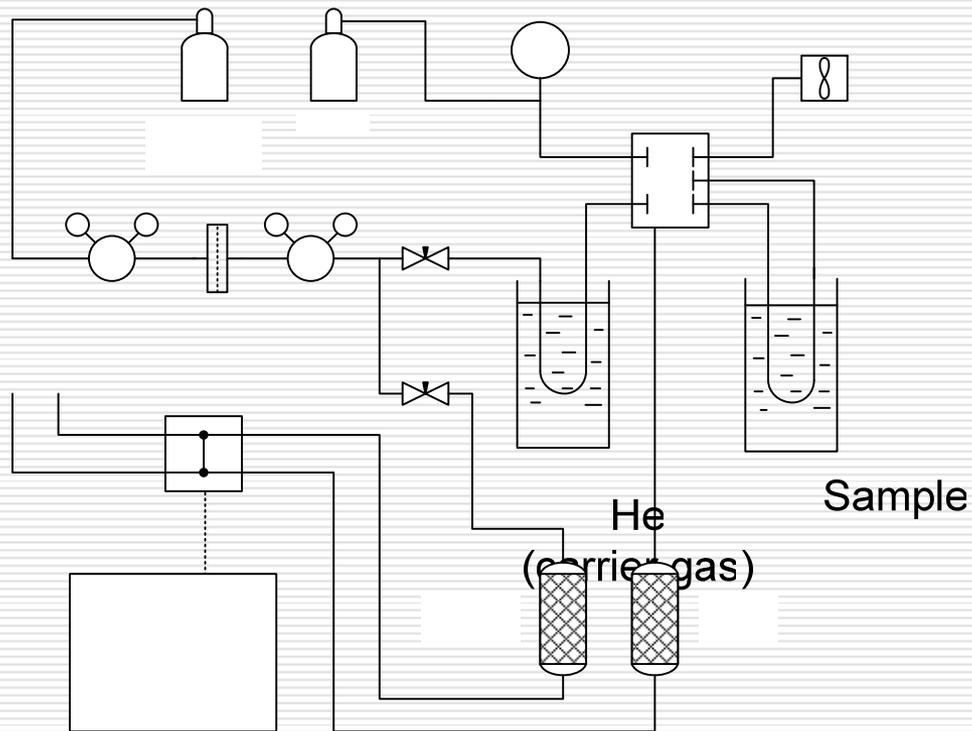

μ SC muon rate with kicker (kHz)	μ SC electron rate (kHz)	Stopping fraction in the TPC
23.3	3.5	48.0 %

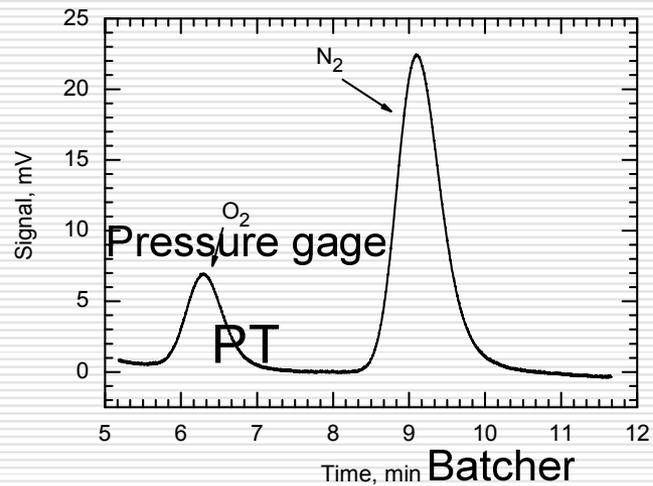

Хроматография

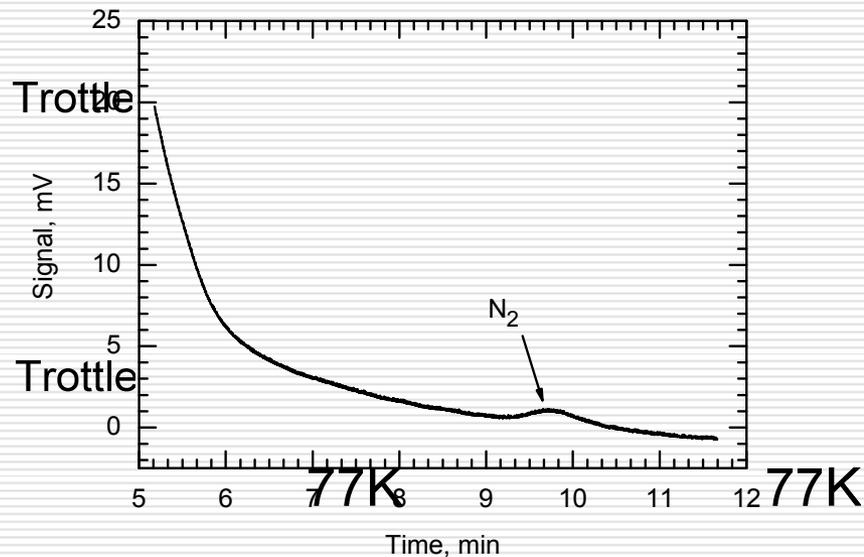

Устойчивый предел чувствительности хроматографического метода при 10 1 пробе

Relief ≤ 1 ppb

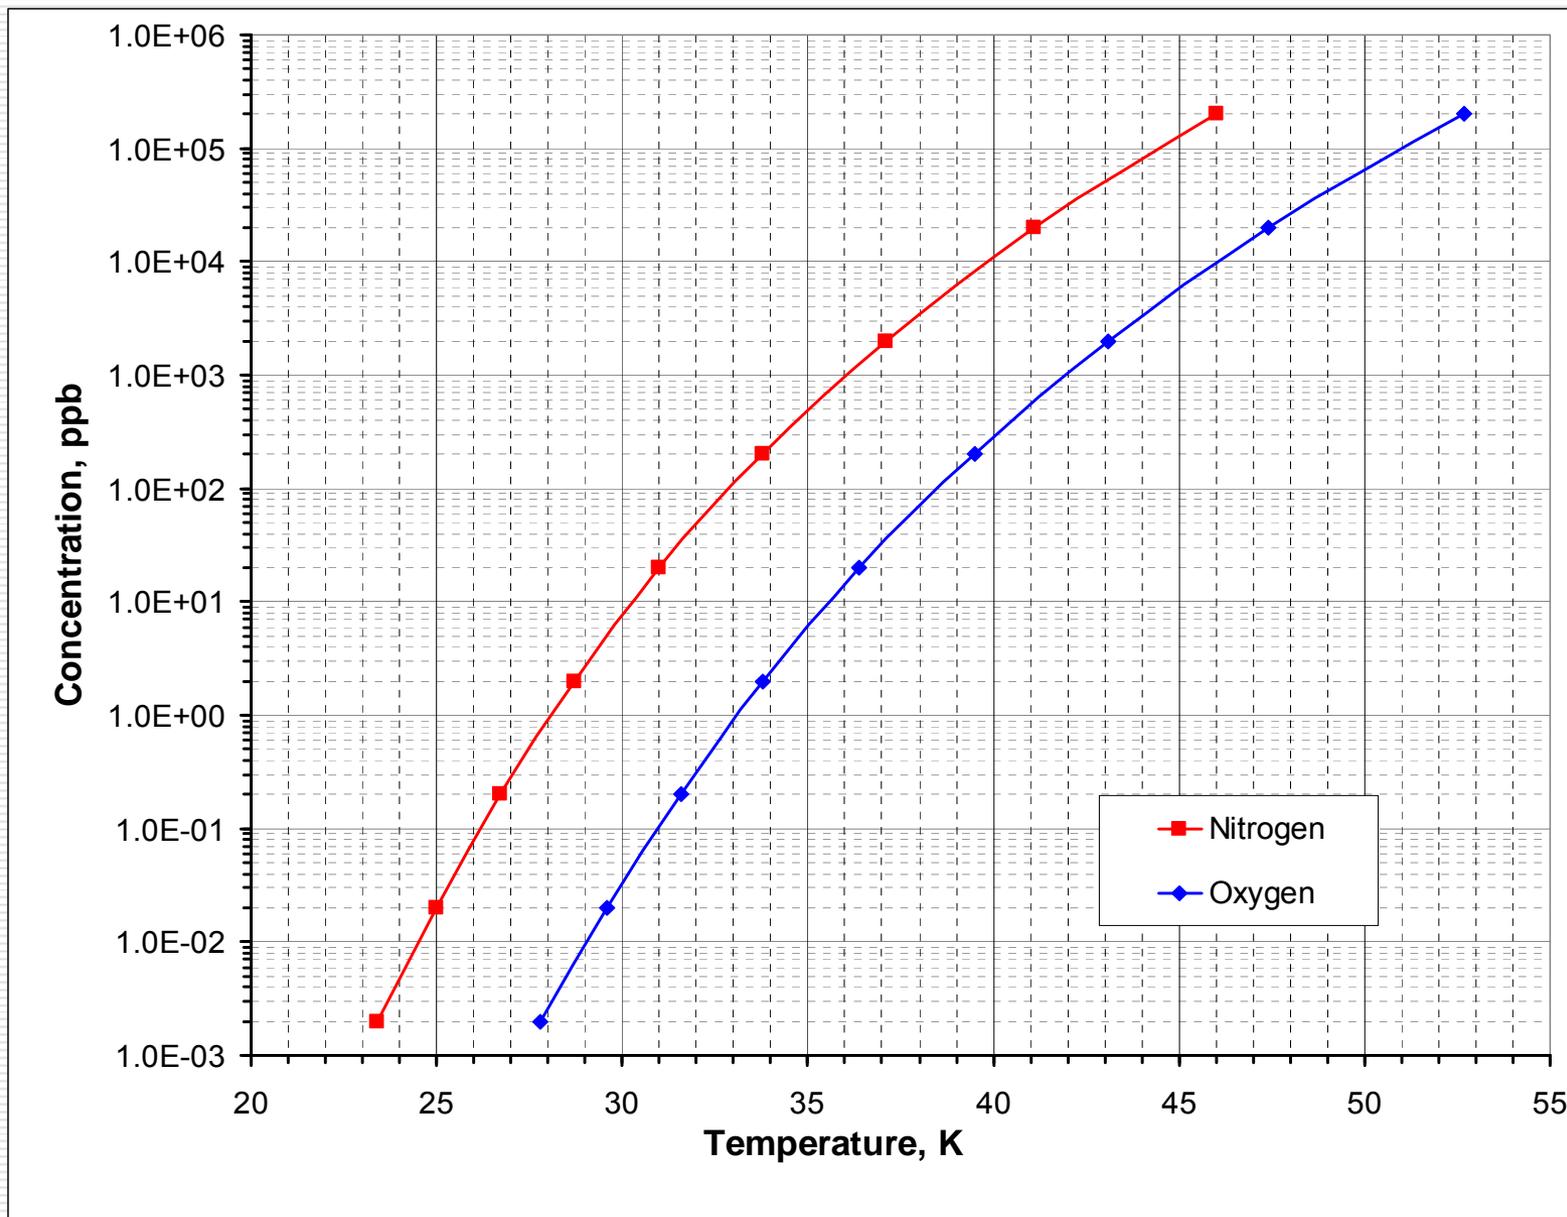

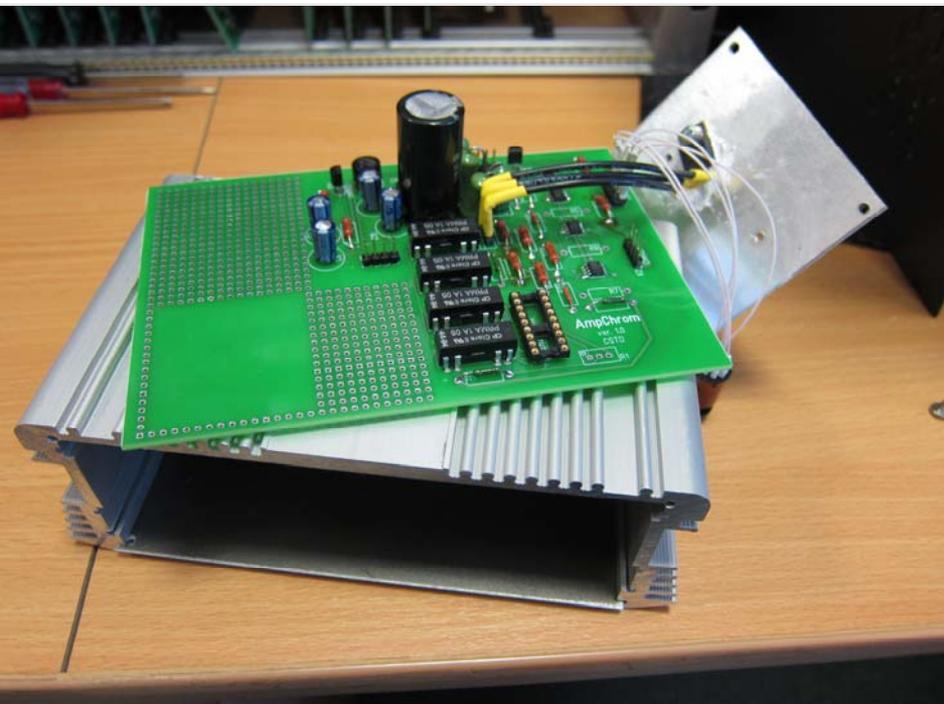

Rotary gas

Давление насыщенных паров азота и кислорода

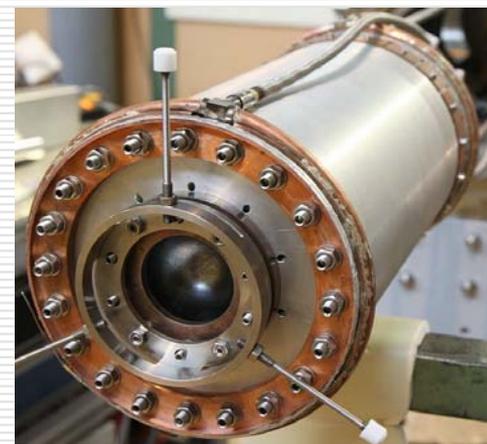

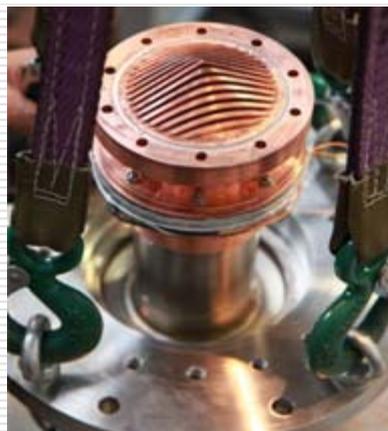

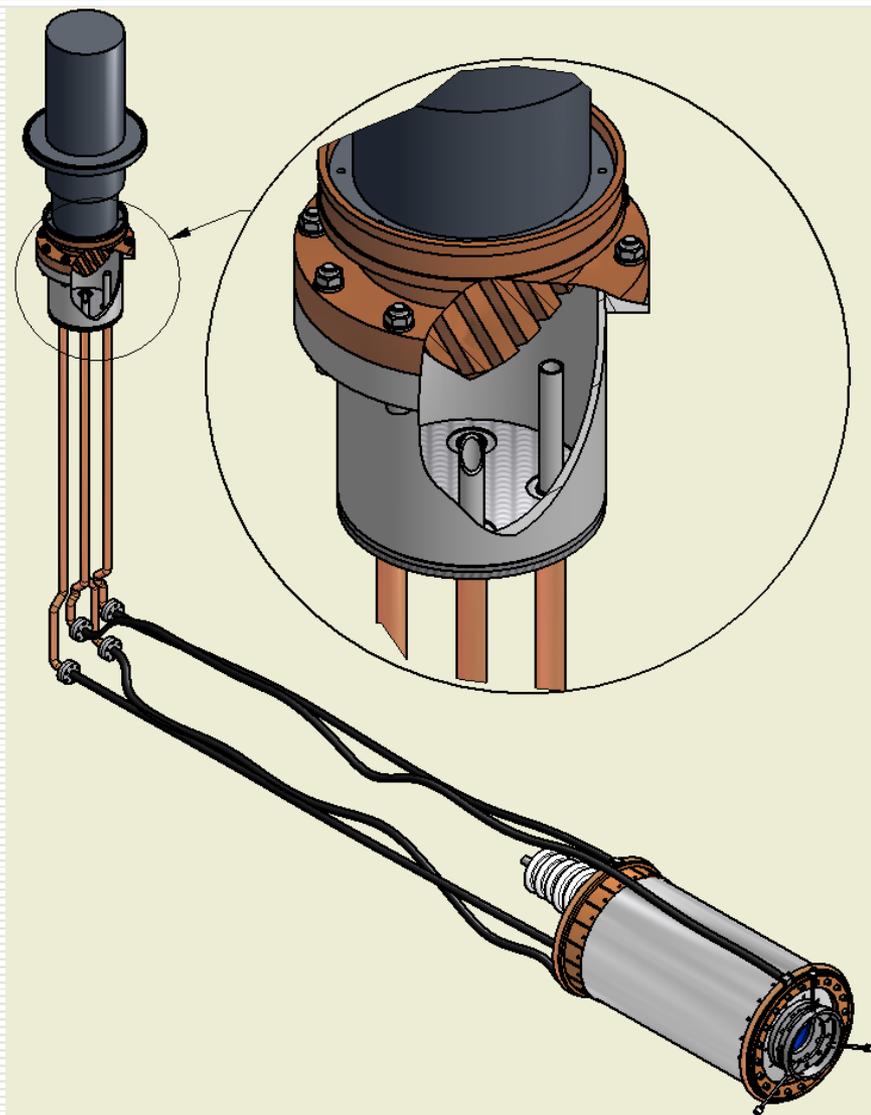

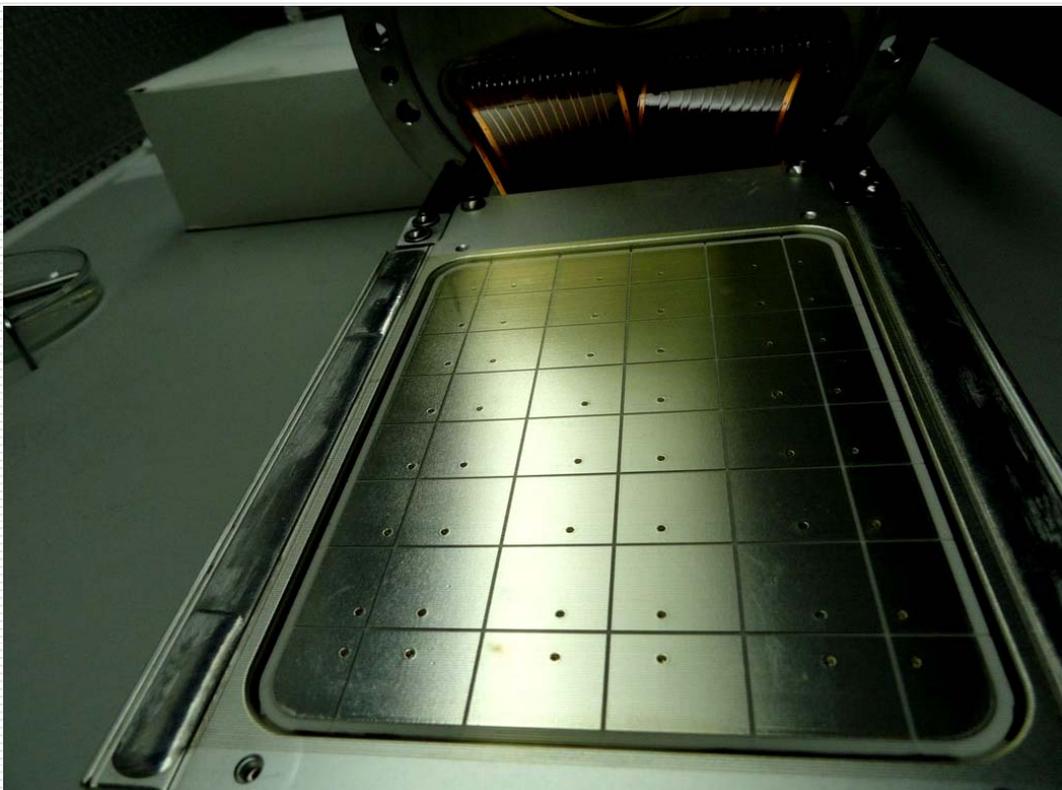

Получение дейтерия.
Примесь протия менее 100 ppb

Постоянное увеличение содержания протия из-за обмена с водой
 ~ 1 ppm/day

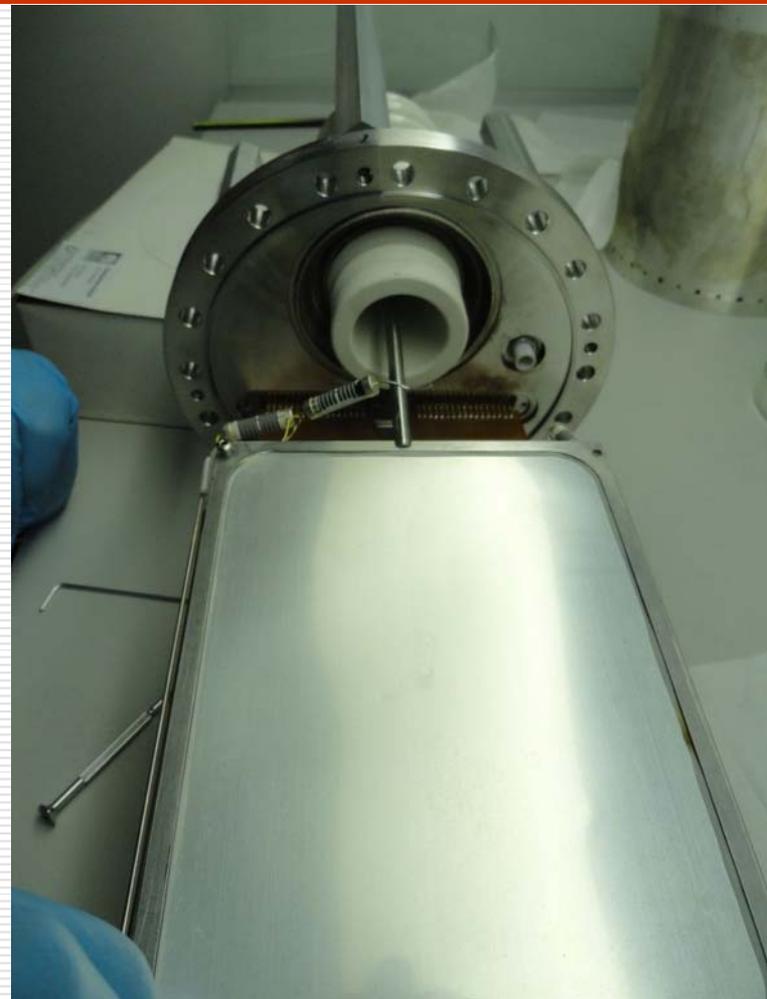

< 100 ppm не требует внесения поправок

Смена дейтерия после 1 месяца работы

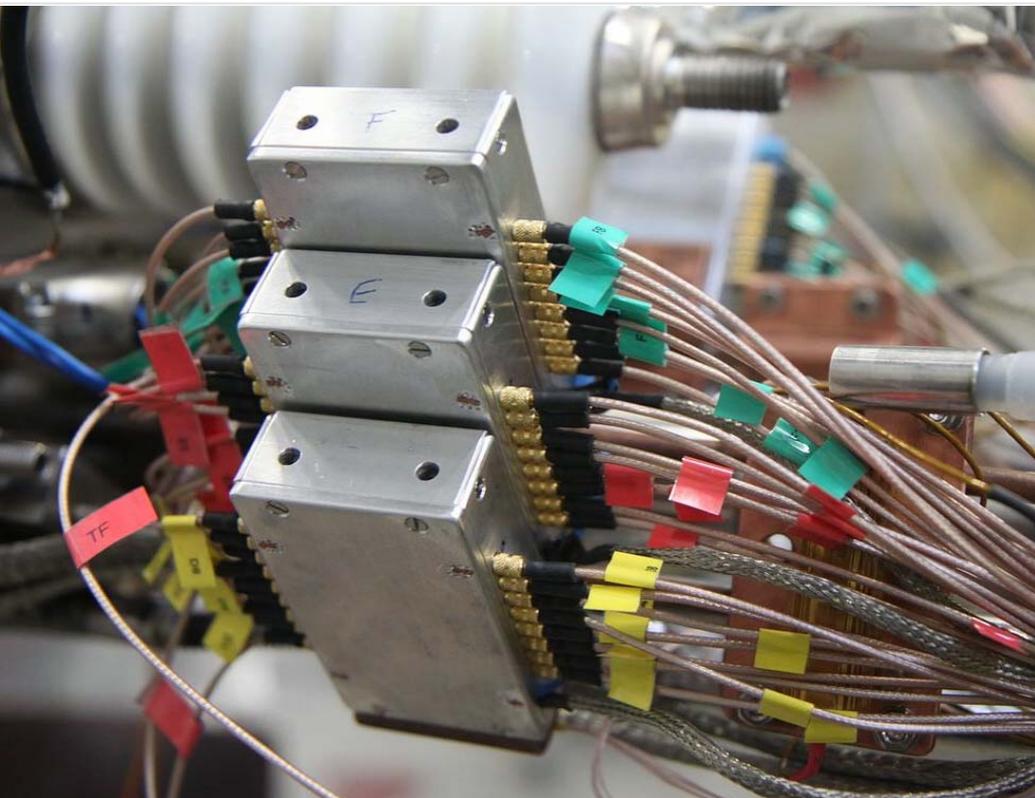

Падовая плоскость с серебряными падами

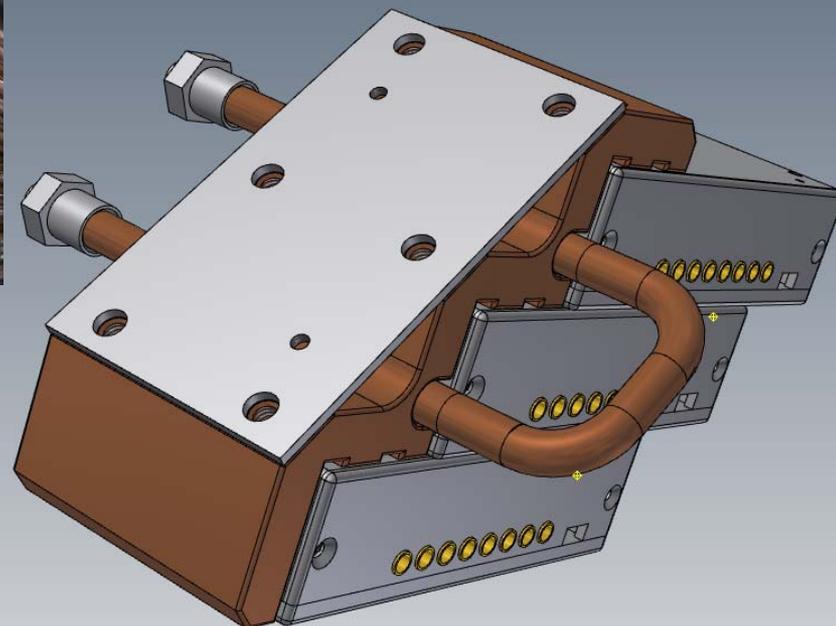

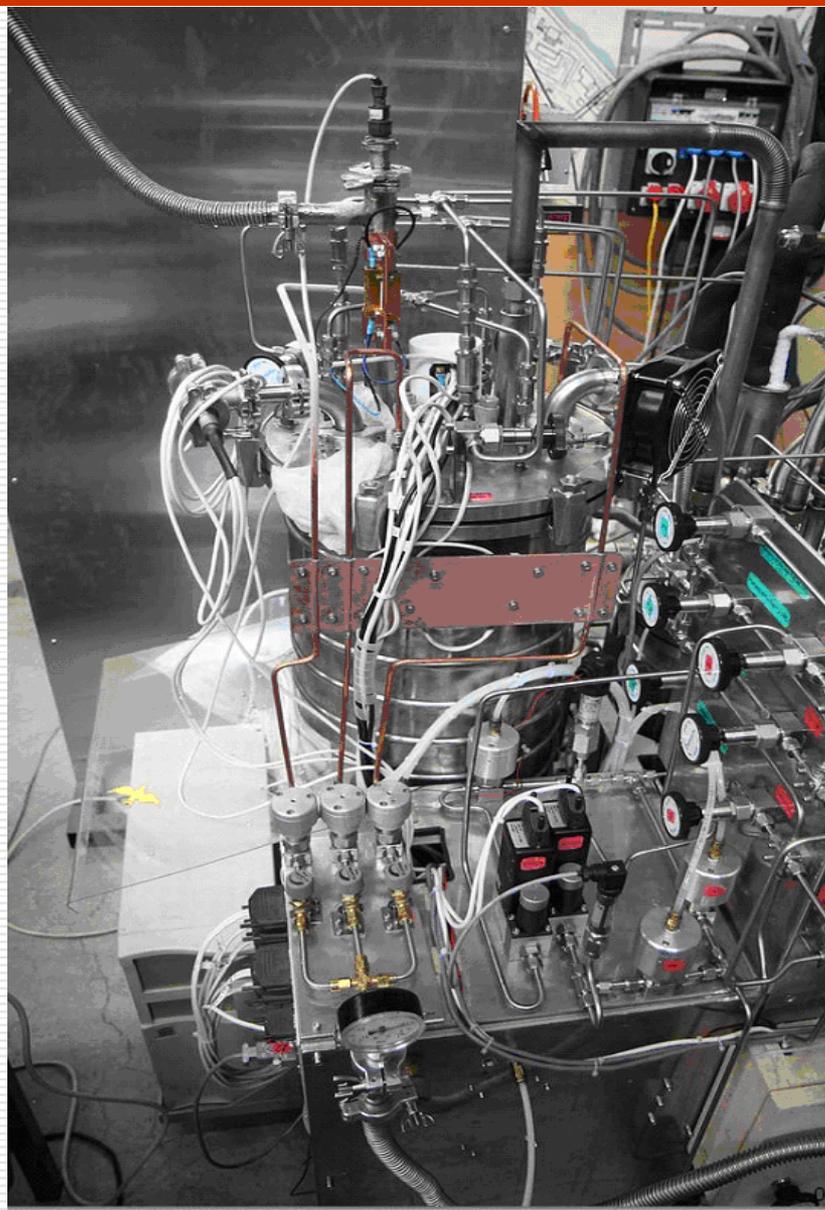

Катодная плоскость из серебряной фольги

Энергетическое разрешение 25 kV (против 40 kV в предыдущем эксперименте)

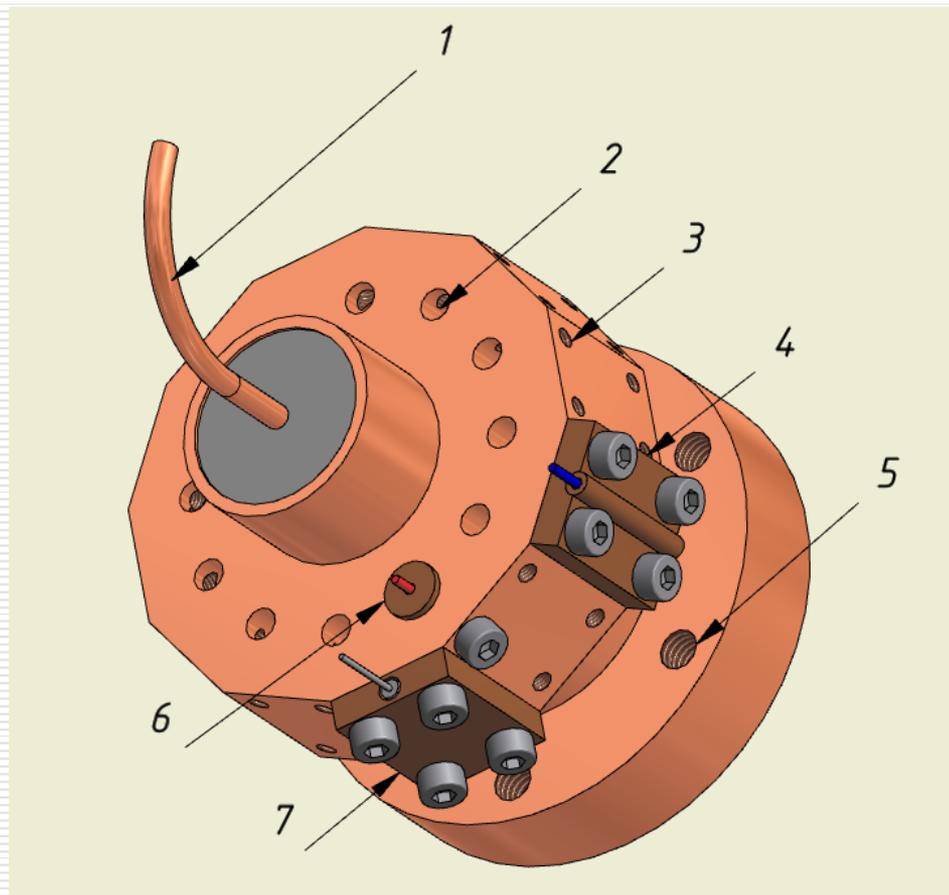

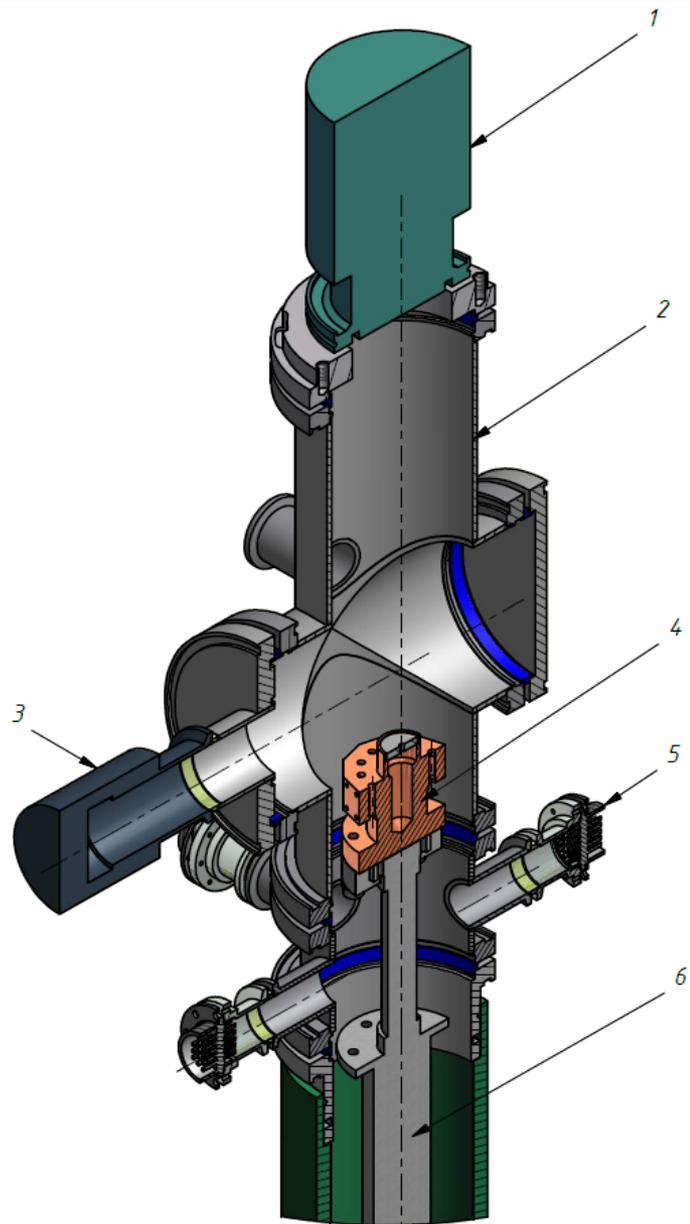

Рабочая температура 140 ± 2 K

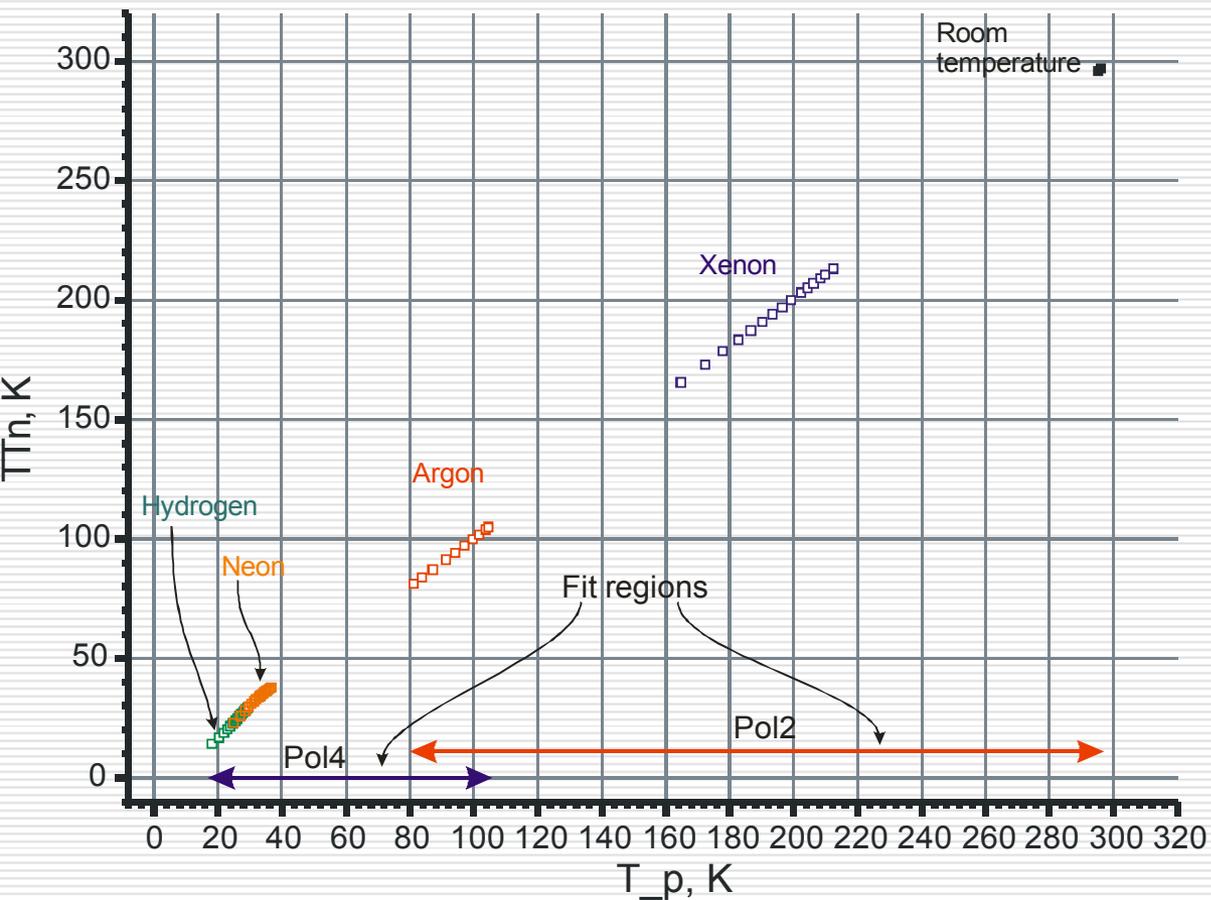

Калибровка датчиков температуры

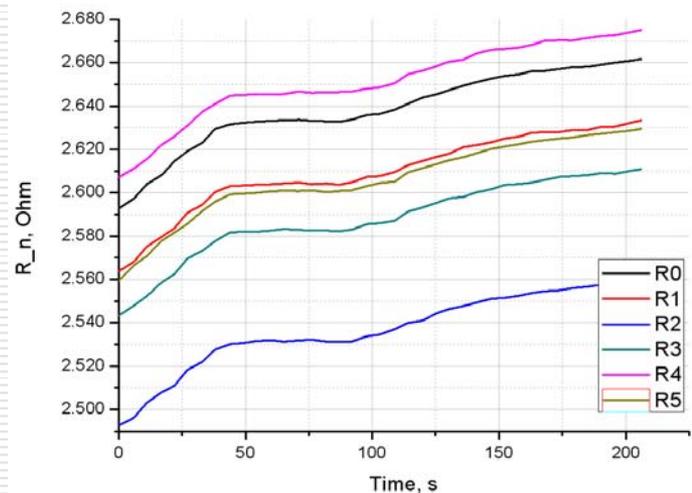

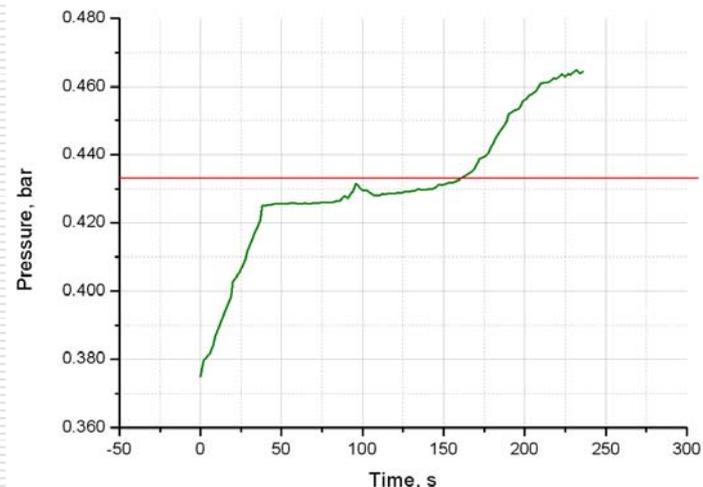

Калибровка датчиков температуры

$T=24,66 K, P= 433 mbar$

Воспроизводимость, стабильность температуры и давления 0.1 K

Установка на пучке $\pi E1$
